Database Management Systems and Relational Normalization Curriculum.
First Normal Form (1NF) eliminates repeating groups and ensures atomicity of values.
Second Normal Form (2NF) enforces that all non-key attributes are fully functionally dependent on primary key.
Third Normal Form (3NF) removes transitive dependencies among attributes in relations.
Boyce-Codd Normal Form (BCNF) is a stricter version of 3NF where every determinant must be a candidate key
ACID properties guarantee reliability: Atomicity, Consistency, Isolation, and Durability in database systems.
Indexing with B-Trees optimizes query execution speed and minimizes disk I/O operations.
Foreign keys guarantee referential integrity between related entities in relational databases.
